Robotics and Automation, 2012

# Task allocation with multirobot tasks

## Multirobot tasks:

Individual robots may not have all the required capabilities

## Task allocation:

- A set of robots,  $R = \{r_1, r_2, \dots\}$
- A set of tasks to be assigned,  $T = \{t_1, t_2, \dots\}$

Find assignments in  $C \rightarrow T$ ,  $C = 2^R$

# Task allocation with multirobot tasks

Given:

- Each robot  $r_i$  is associated with a vector  $\mathbf{B}_i$  capabilities
- Each task  $t_l$  requires a vector  $\mathbf{P}_l$  capabilities
- A vector  $\mathbf{W}$  of costs for capabilities
- A vector  $\mathbf{V}$  of rewards for tasks
- Communication and coordination costs,  $\mathcal{C} \times \mathcal{T} \rightarrow \mathbb{R}^0$
- A utility function  $U$  for  $m_{jl} = c_j \rightarrow t_l$ , defined as  $U(m_{jl}) =$

$$\begin{cases} \mathbf{V}[l] - \sum_h \mathbf{P}_l[h] \mathbf{W}[h] - \text{Cost}(c_j, t_l) & \text{if } \forall h : \sum_{r_i \in c_j} \mathbf{B}_i[h] \geq \mathbf{P}_l[h] \\ 0 & \text{otherwise} \end{cases}$$

$\max \sum U(m)$

A NP-hard problem

# NP-hardness of the task allocation problem

The NP-hardness is partly due to the size of  $C = 2^R$

To reduce the number of coalitions  $|C|$ , previous approaches:

- 1 Consider coalitions that satisfy  $\sum_{r_i \in c_j} \mathbf{B}_i[h] \geq \mathbf{P}_l[h]$
- 2 Restrict coalition size to  $k$ ,  $C = O(R^k)$
- 3 Group homogeneous robots, thus reducing  $|R| = \sum_k N_k$  to  $k$

Previous approaches to reduce  $|C|$  – Approach 1

Considering coalitions that satisfy task capability requirement (i.e.,  $\sum_{r_i \in c_j} \mathbf{B}_i[h] \geq \mathbf{P}_i[h]$ )

# Previous approaches to reduce $|C|$ – Approach 1

Considering coalitions that satisfy task capability requirement (i.e.,  $\sum_{r_i \in C_j} \mathbf{B}_i[h] \geq \mathbf{P}_i[h]$ )

Issue:

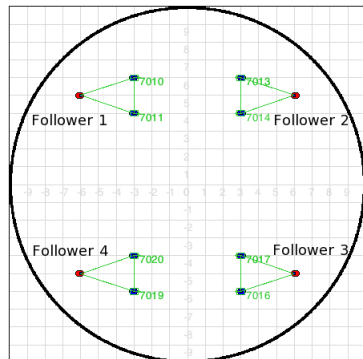

$|C|$  can still be exponential in  $R$

# Previous approaches to reduce $|C|$ – Approach 2

Restricting coalition size to  $k$ ,  
 $C = O(R^k)$

## Previous approaches to reduce $|C|$ – Approach 2

Restricting coalition size to  $k$ ,  
 $C = O(R^k)$

Issues:

1.  $|C|$  is a high order polynomial of  $|R|$
2. Task execution can be super-additive

# Previous approaches to reduce $|C|$ – Approach 3

Grouping homogeneous robots,  
 thus reducing  $|R|$  to  $k$

## Previous approaches to reduce $|C|$ – Approach 3

Grouping homogeneous robots,  
thus reducing  $|R|$  to  $k$

Issue:

Homogeneous robots are often  
not equivalent

# Contributions

1. To address the previous issues for reducing  $|C|$ :
  - Introduce task allocation with *executable coalitions*
2. To perform task allocation:
  - Apply a layering technique to perform task allocation with executable coalitions
3. For tasks with no executable coalitions:
  - Introduce a process that decomposes unsatisfied task preconditions to create task plans

*Executable coalitions*: coalitions that are feasible for task execution in the **current situation**

# What determines an executable coalition

## Approach 1, 2 (task capability, restrict size)

Type	Capabilities	Robot ID
1	Fiducial, Laser	(1 - 4)
2	Fiducial, Laser, Localization	(5 - 12)

## Approach 3 (grouping)

Type	Capabilities	Count
1	Fiducial, Laser	4
2	Fiducial, Laser, Localization	8

# What determines an executable coalition

## Approach 1, 2 (task capability, restrict size)

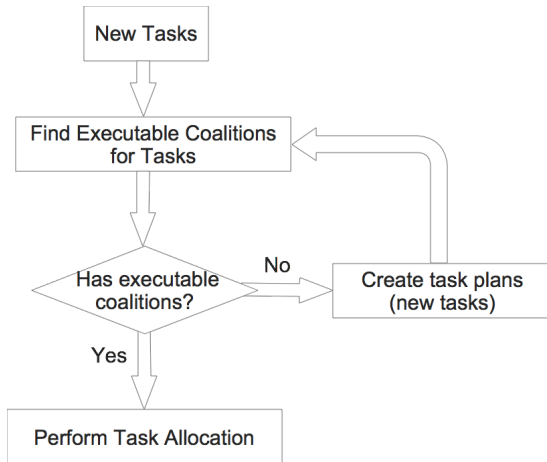

Type	Capabilities	Robot ID
1	Fiducial, Laser	(1 - 4)
2	Fiducial, Laser, Localization	(5 - 12)

## Approach 3 (grouping)

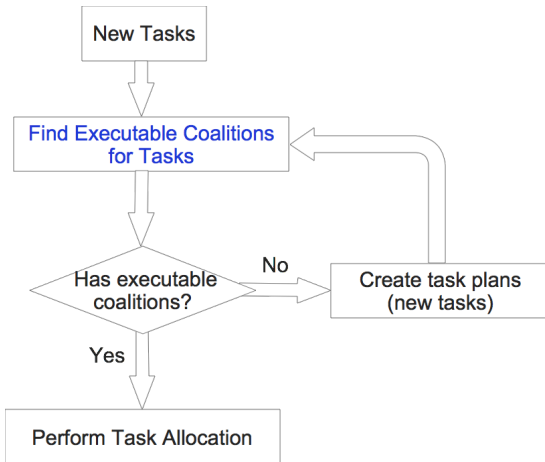

Type	Capabilities	Count
1	Fiducial, Laser	4
2	Fiducial, Laser, Localization	8

The desired configurations (i.e., *preconditions*) for task execution are not considered, which determine whether a coalition is executable.

# Process flow

# Process flow

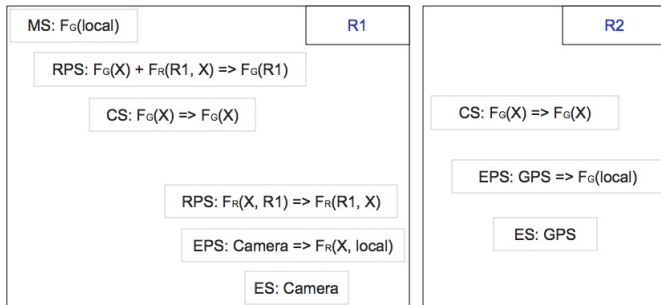

# Forming executable coalitions with IQ-ASyMTRe

IQ-ASyMTRe [Zhang and Parker, 2010b] defines robot capabilities as:

- Motor Schema (MS)
- Environmental Sensor (ES)
- Perceptual Schema (PS)
- Communication Schema (CS)

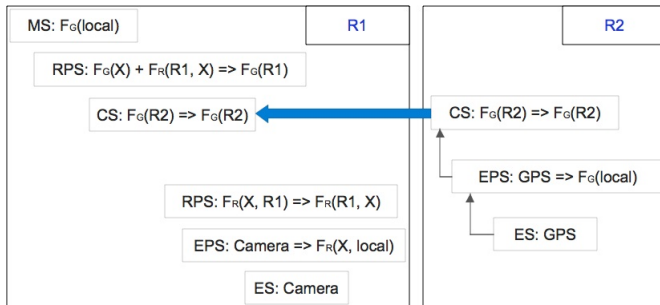

# Forming executable coalitions with IQ-ASyMTRe

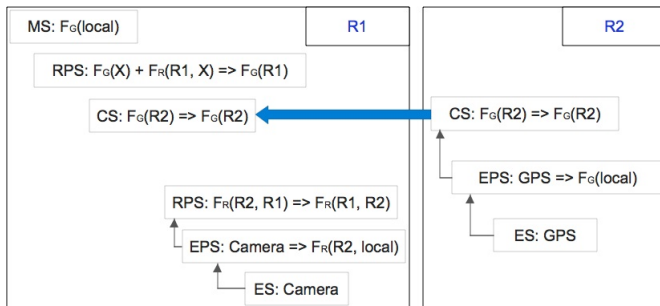

An example

# Forming executable coalitions with IQ-ASyMTRe

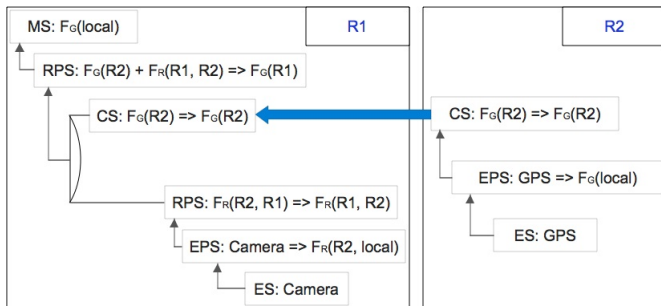

An example

# Forming executable coalitions with IQ-ASyMTRe

An example

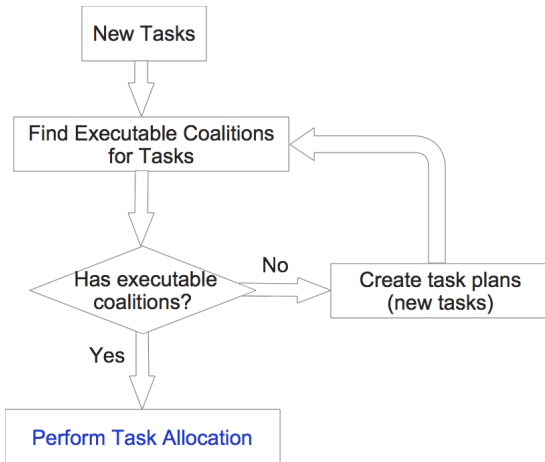

# Forming executable coalitions with IQ-ASyMTRe

An example

Required information flow  $\rightarrow$  proper configurations  $\rightarrow$  satisfied preconditions

# Process flow

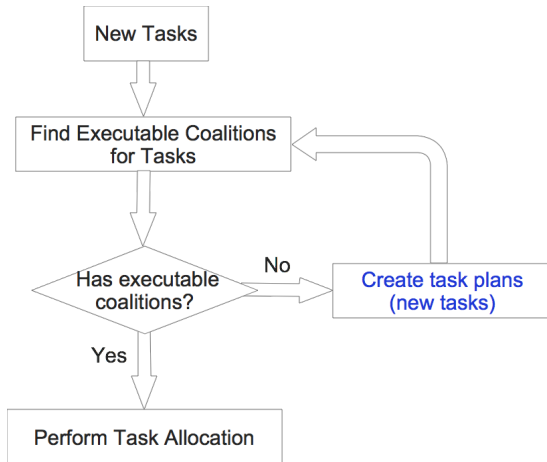

# Layering task allocation

Layer with any task allocation algorithm:

Forming executable coalitions with IQ-ASyMTRe → Task allocation

- Schemas → Robot capabilities
- Desired motor schemas → Required task capabilities
- Schema cost → Capability cost
- Task reward
- CS cost → Communication and coordination costs

# Process flow

# Tasks with no executable coalitions

Extending MS to be capable of outputting information:

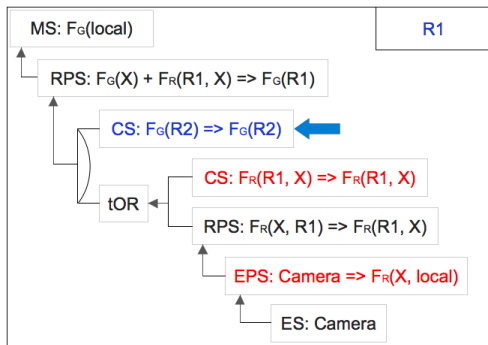

An illustrative example for using IMS

# Tasks with no executable coalitions

Extending MS to be capable of outputting information:

An illustrative example for using IMS

Divide unsatisfied preconditions into satisfiable components

# Tasks with no executable coalitions

## Auctioneer Process

- 1: Create empty *new\_task* and *announced\_task* lists.
- 2: **while true do**
- 3:     Receive new tasks and put them on the *new\_task* list.
- 4:     **for all** tasks in *announced\_list* that are initiating tasks for the new IMS tasks received **do**
- 5:         Update the task's preconditions.
- 6:         Move the task from *announced\_list* to *new\_list*.
- 7:     **end for**
- 8:     *IMS Auction: announce tasks in *announced\_list*.*
- 9:     *Easy Auction: announce tasks in *new\_task* list for which preconditions are satisfied.*
- 10:     Move the announced tasks to *announced\_list*.
- 11:     Wait a while for bids.
- 12:     Collect bids from robots.
- 13:     Invoke task allocation algorithms to determine the task assignments.
- 14:     Remove tasks that are assigned from *new\_task* list.
- 15:     Move tasks for which no bids are submitted or no bids are beneficial to *announced\_list*.
- 16: **end while**

# Tasks with no executable coalitions

## Auctioneer Process

```
1: Create empty new_task and announced_task lists.
2: while true do
3:   Receive new tasks and put them on the new_task list.
4:   for all tasks in announced_list that are initiating tasks
     for the new IMS tasks received do
5:     Update the task's preconditions.
6:     Move the task from announced_list to new_list.
7:   end for
8:   IMS Auction: announce tasks in announced_list.
9:   Easy Auction: announce tasks in new_task list for which
     preconditions are satisfied.
10:  Move the announced tasks to announced_list.
11:  Wait a while for bids.
12:  Collect bids from robots.
13:  Invoke task allocation algorithms to determine the task
     assignments.
14:  Remove tasks that are assigned from new_task list.
15:  Move tasks for which no bids are submitted or no bids
     are beneficial to announced_list.
16: end while
```

## Robot Process

```
1: while true do
2:   if the robot has a winning bid then
3:     Set up the coalition and execute the task.
4:   end if
5:   Receive new task announcements.
6:   for all received tasks do
7:     if task announced for Easy Auction then
8:       Invoke IQ-ASyMTRe to search for
         executable coalitions and submit bids.
9:     else if task announced for IMS Auction then
10:      Invoke IQ-ASyMTRe to submit
        information task requests.
11:     end if
12:   end for
13: end while
```

# Task allocation with executable coalitions

## Example configurations

Previous approaches to reduce  $|C|$  vs. [Executable coalitions](#)

Followers can navigate / # followers	# executable coalitions	# coalitions for approach 1	# executable coalitions with $k = 3$	# coalitions combining approach 1, 2 with $k = 3$
4/4	12	3824	12	192

# Task allocation with executable coalitions

What about in random configurations?

# Task allocation with executable coalitions

Previous approaches to reduce  $|C|$  vs. Executable coalitions

Followers can navigate / # followers	# executable coalitions	# coalitions for approach 1	# executable coalitions with $k = 3$	# coalitions combining approach 1, 2 with $k = 3$
4/4	33	3824	17	192
3/4	13	3824	9	192
2/4	3	3824	3	192
2/4	5	3824	3	192
2/4	6	3824	5	192
1/4	3	3824	3	192
2/4	15	3824	9	192
4/4	4	3824	4	192
4/4	11	3824	9	192
4/4	12	3824	11	192

Task allocation with executable coalitions can significantly reduce the number of coalitions

# Tasks with no executable coalitions

Robots can autonomously create task plans

# A general scenario

# Contributions

- Introduce task allocation with executable coalitions
- Apply a layering technique to perform task allocation with IQ-ASyMTRe
- Introduce a process that decomposes unsatisfied task preconditions to create task plans
